Chapter 3 outline

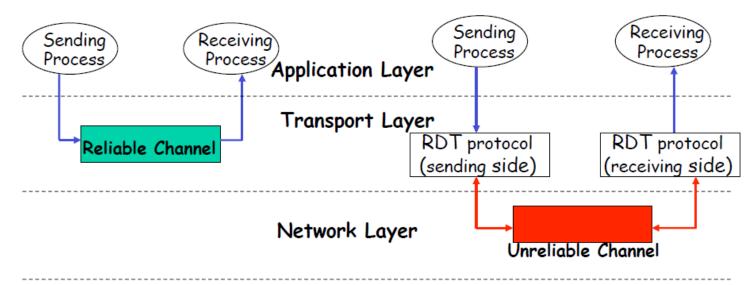

- 3.1 Transport-layer services
- 3.2 Multiplexing and demultiplexing
- 3.3 Connectionless transport: UDP
- 3.4 Principles of reliable data transfer

- 3.5 Connection-oriented transport: TCP
 - segment structure
 - o reliable data transfer
 - flow control
 - connection management
- □ 3.6 Principles of congestion control
- □ 3.7 TCP congestion control

Principles of Reliable Data Transfer

- Fundamentally important networking topic!
- □ Why do we need reliable data transfer protocol?

- What can happen over <u>unreliable</u> channel?
 - Message error
 - Message loss

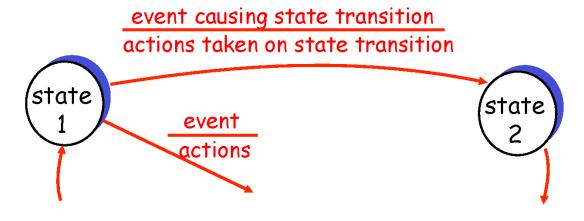

到一种是对种的

<u>Let's Build simple Reliable Data</u> Transfer Protocol

We'll:

- incrementally develop sender, receiver sides of reliable data transfer protocol (rdt)
- consider only stop-and-wait protocol
- use finite state machines (FSM) to specify sender, receiver

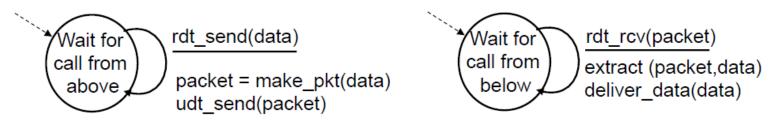

state: when in this "state" next state uniquely determined by next event

Rdt1.0: <u>Data Transfer over a Perfect Channel</u>

- underlying channel is perfectly reliable
 - o no packet errors
 - no packet loss

- → RDT가 따게 활度× (but 時期 學)
- What mechanisms do we need for reliable transfer?
 - Nothing! Underlying channel is reliable!

sender

receiver

Rdt2.0: channel with packet errors (no loss!)

- What mechanisms do we need to deal with error?
 - Error detection
 - Add checksum bits
 - Feedback
 - Acknowledgements (ACKs): receiver explicitly tells sender that packet received correctly
 - Negative acknowledgements (NAKs): receiver explicitly tells sender that packet had errors
- Retransmission
 - sender retransmits packet on receipt of NAK
- □ So, we need the following mechanisms:
 - Error detection, Feedback (ACK/NACK), Retransmission

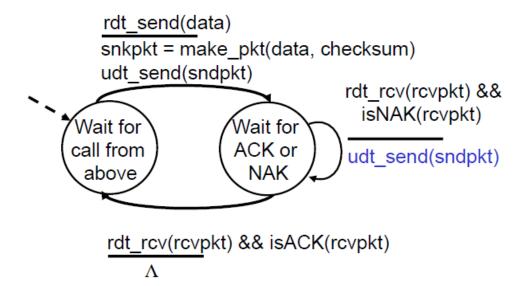

ex) 전화: 이러 있는데 신뢰성 리수(출전)

rdt2.0: FSM specification

sender

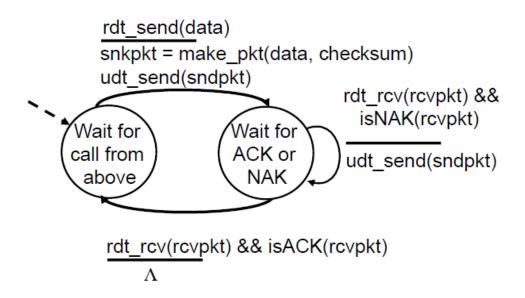

receiver

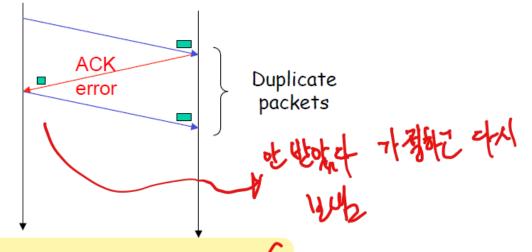

rdt2.0: Can this completely solve errors?

sender

What happens when ACK or NAK has errors?

Approach: resend the current data packet?

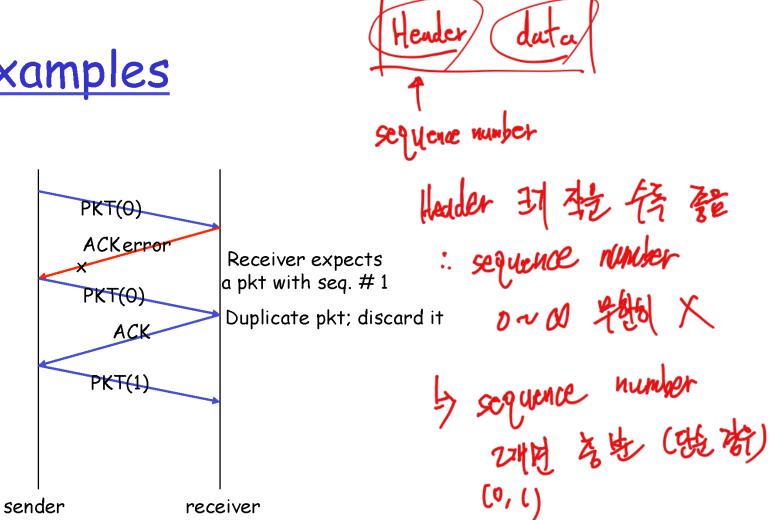

The received packet is new or duplicate?

						· . ·	جعج با	ence	় ঙ	好美	当	0,		

Handling Duplicate Packets

- Sender adds sequence number to each packet
- Sender retransmits current packet if ACK/ NAK garbled
- Receiver discards duplicate packet

rtd2.1: examples

rdt2.1: summary for packet error

- Mechanisms for channel with packet errors
 - Error detection, Feedback, Retransmission, Sequence#

Sender:

- seq # added to pkt
- must check if received ACK/NAK corrupted
- Retransmit on NAK or corrupted feedback

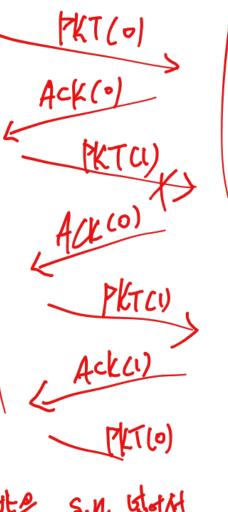

Receiver:

- must check if received packet is duplicate
- send NAK if received packet is corrupted
 - Send ACK otherwise

rdt2.2: a NAK-free protocol

- □ Same functionality as rdt2.1, using ACKs only
- Instead of NAK, receiver sends ACK for last correctly received packet
 - Receiver must explicitly include seq # of pkt being ACKed
- Duplicate ACK at sender results in same action as NAK: retransmit current pkt

rdt3.0: channel with loss & packet errors

- □ What mechanisms do we need for packet loss?
 - Timer!

到的 祖 班 好好 影婚

- □ Sender waits "reasonable" amount of time for ACK (a Time-Out)
- I Attoll obstate

□ If packet (or ACK) is just delayed (not lost):

船班至平

 Retransmission will be duplicate, but use of seq. #'s already handles this

双独

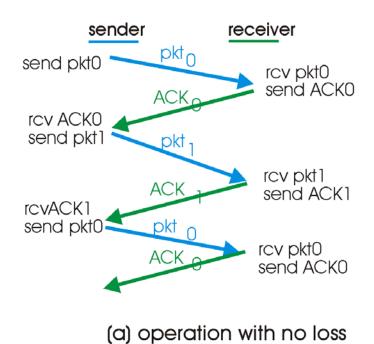

but packet of 15th

Recap: Principles of Reliable Data Transfer

- What can happen over unreliable channel?
 - Packet error, packet loss
- What mechanisms for packet error?
 - Error detection, feedback, retransmission, sequence#
- What mechanisms for packet loss?
 - Timeout!
- We built simple reliable data transfer protocol
 - Real-world protocol (e.g., TCP) is more complex, but <u>with</u> <u>same principles!</u>

Performance of rdt3.0

- □ rdt3.0 works, but performance stinks
- □ example: 1 Gbps link, 15 ms e-e prop. delay, 1KB packet:

$$T_{transmit} = \frac{L (packet length in bits)}{R (transmission rate, bps)} = \frac{8kb/pkt}{10**9 b/sec} = 8 microsec$$

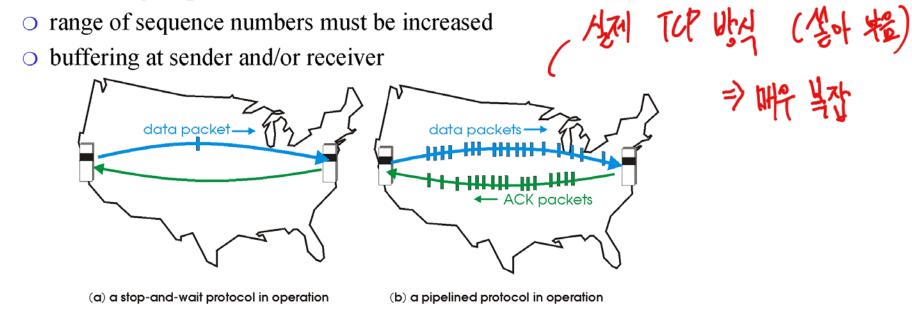

O U sender: utilization – fraction of time sender busy sending

$$U_{\text{sender}} = \frac{L/R}{RTT + L/R} = \frac{.008}{30.008} = 0.00027$$

- 1KB pkt every 30 msec -> 33kB/sec thruput over 1 Gbps link
- o network protocol limits use of physical resources!

Pipelined protocols

Pipelining: sender allows multiple, "in-flight", yet-to-beacknowledged pkts

■ Two generic forms of pipelined protocols: go-Back-N, selective repeat
